Assignment 1

Aim: To Compare Airline websites using usability principles and identify improvements for a flight-booking interface

Comparative analysis:

Air india: Provides flight booking, check in and travel information but some sections can be improved through clearer navigation and layout

Indigo: offers a straight forward flight search process, although promotional content can sometimes distract users.

~~Design Decisions:~~

Overall comparision: Both websites support flight booking, checkin, and travel info, but some sections can be improved through clearer navigation which is important for improving usability

Design Decisions: Our interface uses a clean layout readable text, clear buttons and simple flight-search option

Conclusion: The Comparision helped identify important usability improvements for our flight booking prototype

Aim: To understand user needs
Create an Empathy map and Persona
identify research gaps for flight

Empath Map:
Says: wants affordable flights and
process

Thinks: wonder whether fare include
other charges

Feels: Confused by complicated form

Needs: clear prices, reliable info and

User Personas: first time trave
flyers, Users with disabilities and
conscious travellers

Research Gap: Existing airline w
may overwhelm users with extra
fare comparisions or specials
to find

Assignment 3

Aim: To create low fidelity wireframes for the flight booking interface.

Wireframe Description:
The home screen includes sources and destination fields, departure and return dates, passenger selection and a search button. The result screen lists flight fares, timings, and filters. The booking screen collects passengers details and displays the fare summary before payment.

Design Decisions: The wireframes prioritize simple navigation, clear info hierarchy and fewer unnecessary steps.

Conclusion: Low-fidelity wireframes helped establish the structure and flow of flight booking interface before visual design.

Assignment

Aim: To convert low fidelity wire
high fidelity screens and crea
figma prototype

UI implementation: The home scr
a clear flight search form with s
date and passenger selection. Th
page displays flight timing, pric
the booking page includes passenger
breakdown and a payment option

Design Desicion: A consistent colou
readable typography, accessible
clear visual hierarchy are use
the interface

Conclusion: The high fidelity prot
the main flight booking journey th
screens

Assignment-5

Aim: To evaluate the flight booking prototype using nielsen usability heuristics and identify areas for improvement

Findings

Visibility of system status: show booking errors and confirmation messages

Match with the real world: Use familiar terms like airport codes

User control: Allow users to edit search details and return to prev steps

Consistency: Maintain uniforms button, colours & layout

Error prevention: Validate passenger detail & highlight missing fields

Areas of improvement: improve error messages make fare details clearer and highlight miss

Ensure accessible text and controls

Conclusion: Heuristic evaluations helps identify usability issues and improve the flight booking experience.

Assignment 6

Aim: to study Usability testing of a figma prototype using a remote testing tool (Maze)

Problem statement: study how the tool Maze can be used for unmoderated remote user testing of a website design created in figma

Theory:

Maze is a remote user testing platform that let designer test a clickable prototype with real users without writing any code.

Maze is an easy to use tool and a test can be started in minutes. Maze provides

- Direct import of figma prototype
- Missions (task)
- Heatmaps
- success rate, misclick rate and duration metrics
- Automatic reports can be exported

following task is done using Maze:

A/B testing

Understanding confusing elements

Identify user behaviour

Test new ideas

study user clicks n misclicks

Find the best user flow

Conclusion: Hence we have studied Usability of figma prototype using Maze

FAQs

1. Describe the objective of user testing
Ans It is to evaluate products usability and improve the feedback based on user feedbacks

2. Discuss Different Methods of User testing
- Usability
- A/B testing
- Remote testing
- In person

3) Explain features n Benefits of Maze
Ans
- Test prototypes & design
- Collect user feedback
- ~~Parts of~~

Benefits
- Saves time n Cost
- Identify Usability issues

Assignment No. 7

Aim: To redesign an existing interface for users with visual needs and create an accessible, inclusive, intuitive

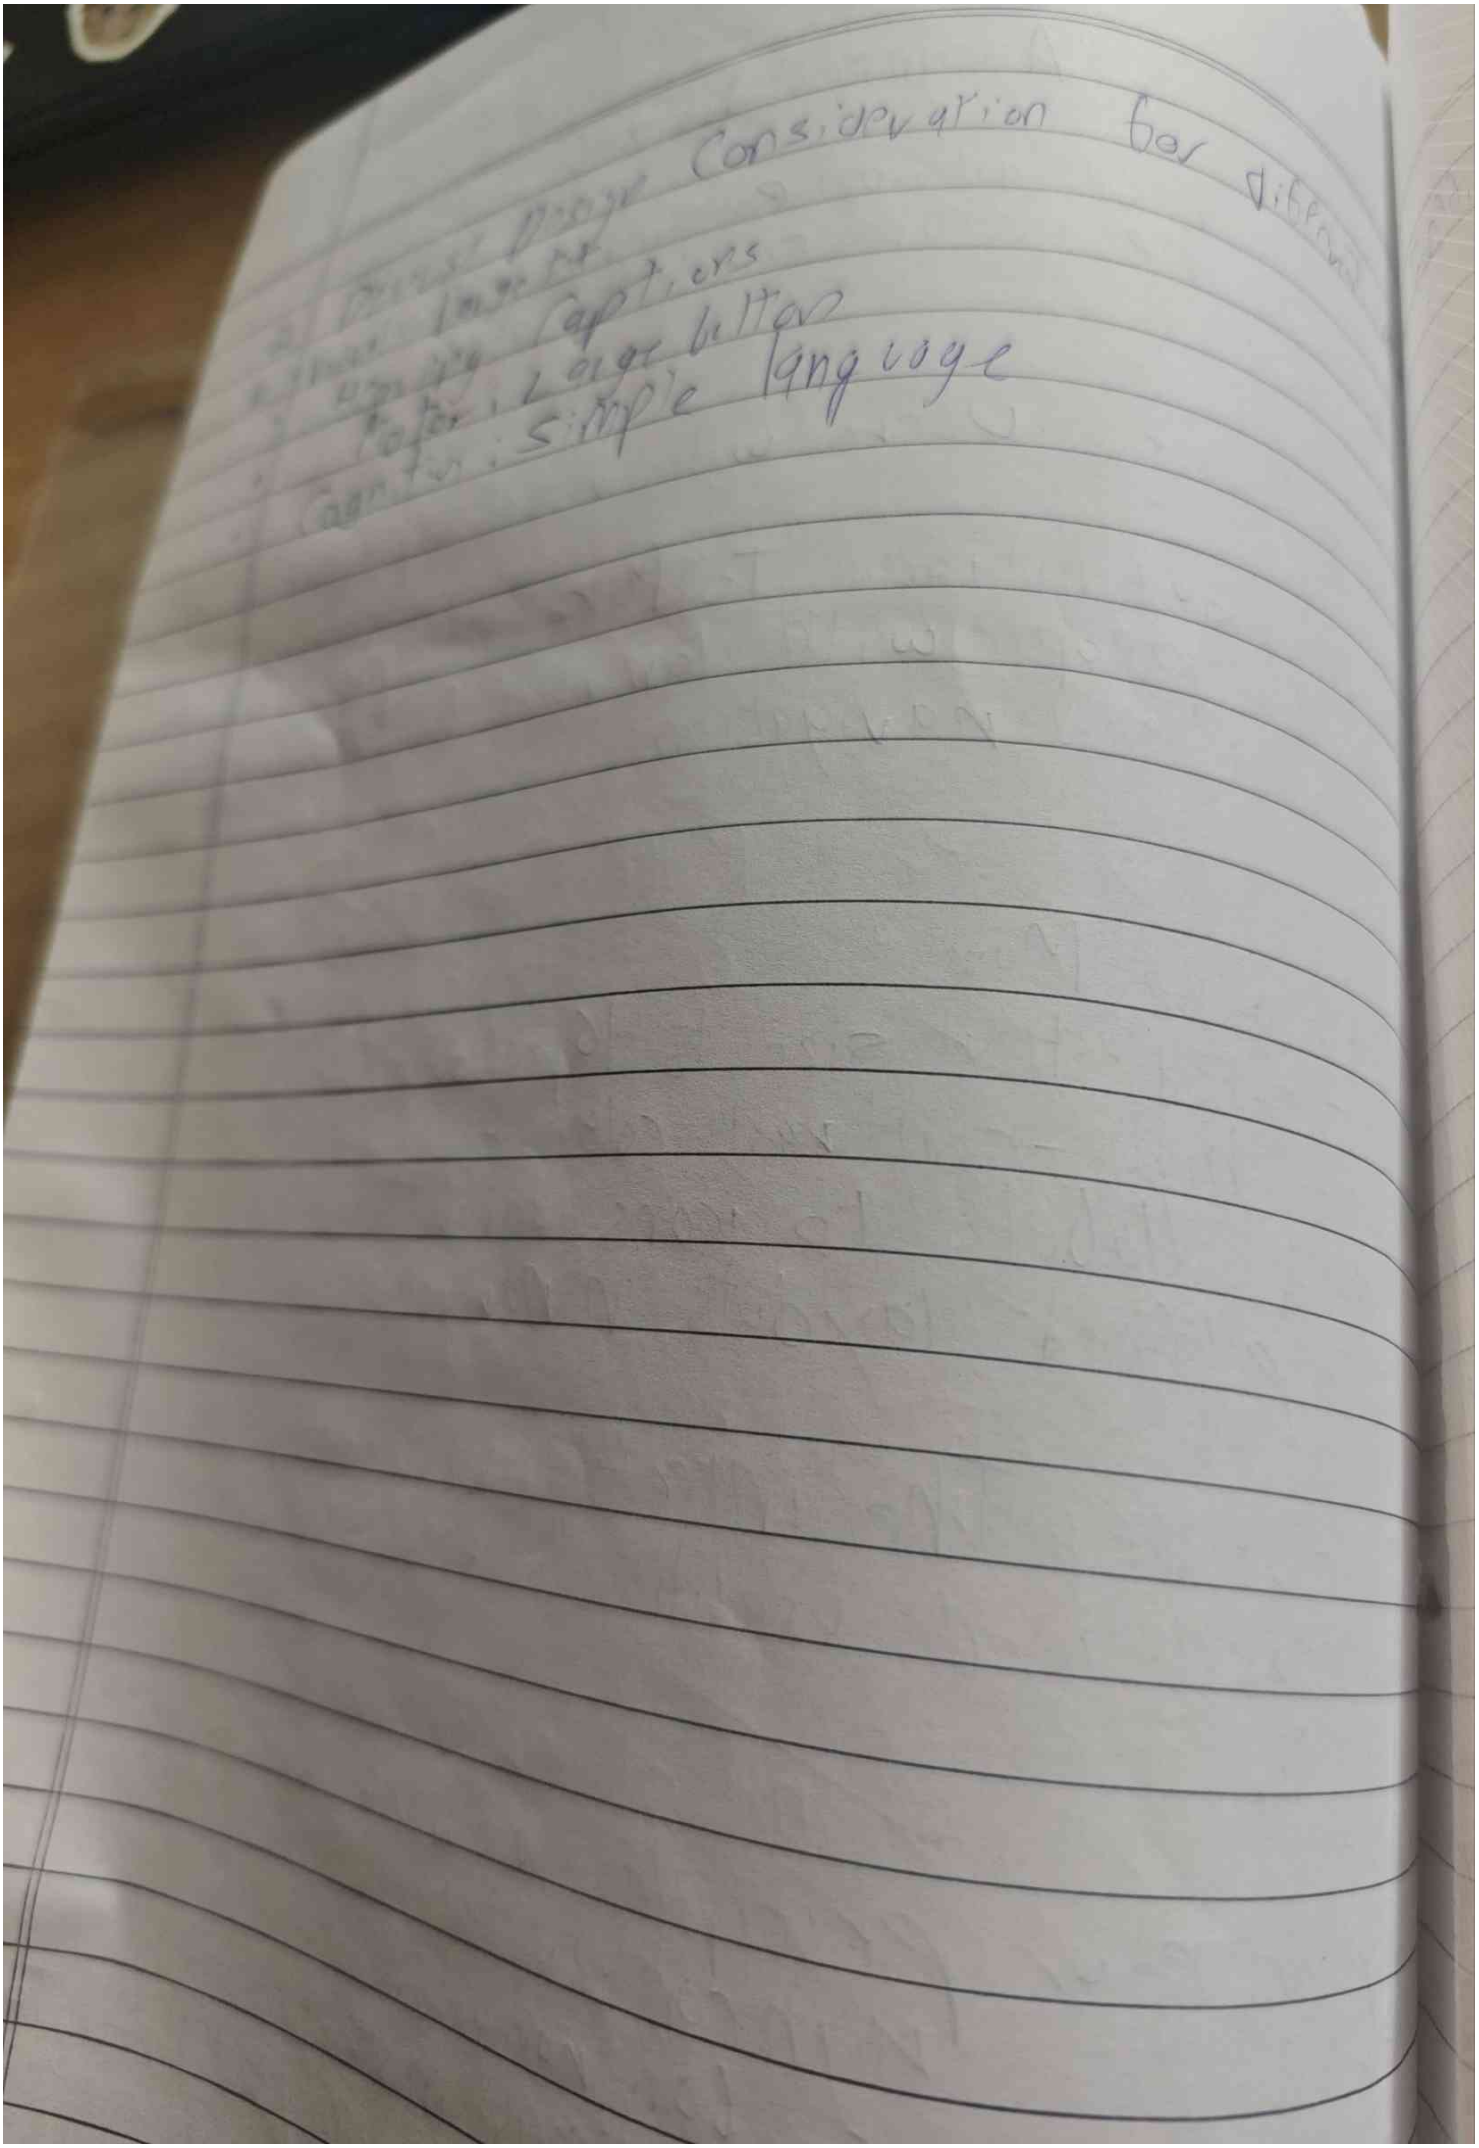

Target user: Users with visual impairment

Problem definition: To Make the application easy to use for people with low vision by improving reading contrast and navigation

Modification Made:
Increased text size to 16px or more
Used high-contrast colors
Added labels to icons and buttons
Simplified layouts in navigation

Conclusion: The interface was redesigned to improve accessibility and usability for users with visual impairment

FAQs
Explain four priciples of WCAG with examples
Perceivable: High contrast text
Operable: Keyboard navigation
Understandable: simple instruction
Robust: Screen reader-compatible buttons

Consideration for
Captions
Font: Larger letter
Caption: simple language
